AMQP is a framing and transfer protocol. Framing means that it provides structure for binary data streams that flow in either direction of a network connection. The structure provides delineation for distinct blocks of data, called frames, to be exchanged between the connected parties.

AMQP version 1.0 supports various broker architectures that may be use to receive, queue, route, and deliver messages or be used peer-to-peer. There are three major pieces specified in the scope of AMQP 1.0. These define the networking protocol, a representation for message envelope data and the basic semantics of broker services.

The Advanced Message Queuing Protocol (AMQP) is an open internet protocol for business messaging. It defines a binary wire-level protocol that allows for the reliable exchange of business messages between two parties. AMQP has a layered architecture and the specification is organized as a set of parts that reflects that architecture.

Broker-model independent: The AMQP 1.0 specification does not make any requirements on the messaging model used by a broker. This means that it's possible to easily add AMQP 1.0 support to existing messaging brokers. RabbitMQ MQTT plugin targets MQTT 3.1 and supports a broad range of MQTT clients. It also makes it possible for MQTT clients to interoperate with AMQP 0-9-1, AMQP 1.0, and STOMP clients. The plugin builds on top of RabbitMQ exchanges and queues. Messages published to MQTT topics use a topic exchange (amq.topic by default) internally.
